

## ZZZZ313 – Test of checking of numpy/lapack

---

### Summarized:

This test does not have any physical meaning, it acts of a data-processing test which is used to check the good performance of certain features of numpy. In particular, one calls on some functions (decomposition of Cholesky, computation of values and eigenvectors) which already posed problem in routines lapack on particular matrixes.

The values tested are values of NON-regression.

This documentation is voluntarily brief.
