

## SHLL103 – Harmonic response of a rotor with two discs and two asymmetric bearings, subjected to the Summarized gyroscopic

---

### effect:

This test makes it possible to validate the computation of the harmonic response of a system of rotating shafts with taking into account of the gyroscopic effect and the bearings asymmetric characteristics.

In this test, there is a model of rotor with two discs, supported by two hydrodynamic bearings, whose stiffness matrixes and of damping linearized are asymmetric. This example as well as the corresponding results of reference are drawn from the handbook of qualification of ROTORINSA, [bib2], computation software to the finite elements intended to envisage the dynamic behavior of rotors in bending.

A good agreement is observed between the results of Code\_Aster and the reference solution.

## 1 Problem of reference

### 1.1 Geometry

a model of rotor supported by 2 bearings (nodes *B1* and *B2* on the figure below), whose stiffness matrixes and of damping are asymmetric. It is composed of 2 discs and 3 sections of shaft.

Image 1.1-1: Model rotor with 2 discs and 2 asymmetrical bearings

### 1.2 Material properties

the geometrical characteristics and material are listed in the following table.

Material		$E = 2.10^{11} \text{ N/m}^2$	$\rho = 7800 \text{ kg/m}^3$	$\nu = 0.3$
Disc	<i>D1</i>	$M = 3.5 \text{ kg}$	$I_D = 3.5 \cdot 10^{-3} \text{ kg m}^2$	$I_P = 7.10^{-3} \text{ kg m}^2$
	<i>D2</i>	$M = 3.0 \text{ kg}$	$I_D = 3.0 \cdot 10^{-3} \text{ kg m}^2$	$I_P = 6.10^{-3} \text{ kg m}^2$

Table 1.2-1 : Geometrical characteristics and material

the characteristics of the bearings are indicated in the table which follows.

Bearin g	<i>P1</i>	$K_{xx} = 8.10^7 \text{ N/m}$	$K_{zz} = 1.10^8 \text{ N/m}$
		$K_{xz} = -1.10^7 \text{ N/m}$	$K_{zx} = -6.10^7 \text{ N/m}$
		$C_{xx} = 8.10^3 \text{ Ns/m}$	$C_{zz} = 1.2 \cdot 10^4 \text{ Ns/m}$
		$C_{xz} = -3.10^3 \text{ Ns/m}$	$C_{zx} = -3.10^3 \text{ Ns/m}$
Bearin g	<i>P2</i>	$K_{xx} = 5.10^7 \text{ N/m}$	$K_{zz} = 7.10^7 \text{ N/m}$
		$K_{xz} = -2.10^6 \text{ N/m}$	$K_{zx} = -4.10^7 \text{ N/m}$
		$C_{xx} = 6.10^3 \text{ Ns/m}$	$C_{zz} = 8.10^3 \text{ Ns/m}$
		$C_{xz} = -1.5 \cdot 10^3 \text{ Ns/m}$	$C_{zx} = -1.5 \cdot 10^3 \text{ Ns/m}$

Table 1.2-2 : Characteristics of the bearings

### 1.3 Boundary conditions and loadings

to block motions of type rigid body in the direction  $y$ , one blocks the degrees of freedom  $DY$  and  $DRY$  with the node bearing  $BI$ .

The loading is a harmonic force at a constant rotational speed.

## 2 Reference solution

---

### 2.1 Method of calculating

the reference solution is that provided by the code ROTORINSA, code finite elements (of standard beam of Timoshenko) intended to envisage the dynamic behavior of rotors in bending.

### 2.2 Quantities and results of reference

They are computations of response to a harmonic force with four different rotational speeds of the rotor: 0,40000,50000 and 60000 *tr/min* .

The excitation frequency of the harmonic force is 1 Hz , 25 Hz and 250 Hz successively.

A each rotational speed of the rotor, two computations are carried out:

- unit harmonic force according to  $X$  applied to the node of the unit  $D2$
- disc harmonic force according to  $Z$  applied to the node of the disc  $D2$

A each time, one records the values of the maximas of amplitude and phase to the node of the disc  $D2$  .

### 2.3 Bibliographical references

1. ROTORINSA, software finite elements intended to envisage the dynamic behavior of rotors in bending, LaMCoS UMR5259, INSA-Lyon.

## 3 Modelization A

### 3.1 Characteristic of the modelization

**Modelization** : 12 Elements équi-distribute beam `POU_D_T` in the direction `y`

### 3.2 Characteristics of the mesh

the rotor is with a grid in 12 finite elements of shaft of the type `POU_D_T` and comprises 4 discrete elements of the type `DIS_TR` for the modelization of the discs and the bearings.

Many nodes: 13  
Number and type of elements: 12 `SEG2`  
4 `POI1`

Images 3.2-1: Characteristics of the model finite elements under ROTORINSA

### 3.3 unit

Loading harmonic Force, applied to the node corresponding to the disc `D2`.

## 5 Summary of the results

---

It is noted that computations of *Code\_Aster* reproduce those of the reference accurately. One notes a good establishment of the gyroscopic effect for the beam element and the discrete element, in the case of harmonic computation.
