

ERREU01 - Test of émission of the error messages of the routines CALCULATION and PRERES

Summary:

This test validates the emission of error messages of the routines `CALCULATION` (elementary calculation not programmed) and `PRERES` (singular matrix).

1 Principle of the test

This test is a data-processing test. It validates that the routine `CALCULATION` an error message emits to say that an elementary calculation is not programmed yet (one tries to calculate a loading of rotation with elements for whom it is not planned) and which the routine `PRERES` a message emits to say that a matrix is singular (one does not block all the modes of rigid body).
