
SSLL108 - Discrete elements 2D

Summary:

The problem is quasi-static linear in mechanics of the structures.

One analyzes the answer of a bar, modelled by 10 discrete elements, with a loading of traction, to validate the two-dimensional discrete elements.

Only one modeling uses at the same time the operators `MECA_STATIQUE`, and `STAT_NON_LINE`, to validate the use of these elements (of which the behavior remains linear) with other finite elements with unspecified behavior.

1 Problem of reference

1.1 Geometry

A bar length $L = 10\text{m}$, along the axis X , modelled by 10 discrete elements with 2 nodes.

1.2 Material properties

Each discrete element has a stiffness: $k = 1\,000\text{ N/m}$

1.3 Boundary conditions and loadings

In $x=0$

$dx = dy = 0$

In $x=L$

$F_x = 10\text{N}$

2 Reference solution

2.1 Method of calculating used for the reference solution

Analytical solution: displacement for an element is given by: $U_x = F/Kx$

Thus for n springs: $U_x = nF/Kx$

2.2 Results of reference

Values of displacement for $x = L/2$ and $x = L$, as well as effort in the elements (constant):

$$U(L/2) = 0.05\text{ m}, \quad U(L) = 0.1\text{ m}, \quad N = 10\text{N}$$

2.3 Uncertainty on the solution

Exact analytical solution.

3 Modeling A

3.1 Characteristics of modeling

Modeling 2D_DISCRET

3.2 Characteristics of the grid

10 meshes SEG2.

3.3 Sizes tested and results

Identification	Reference	Tolerance
MECA_STATIQUE		
$DX(L/2)$	0.05	1.0E-07
$DX(L)$	0.10	1.0E-07
N_{SIEF_ELGA}	10.00	1.0E-03
STAT_NON_LINE		
$DX(L/2)$	0.05	1.0E-07
$DX(L)$	0.10	1.0E-07
N_{SIEF_ELGA}	10.0	1.0E-03

4 Summary of the results

This very simple test voluntarily makes it possible to check the good performance of the discrete elements 2D with `STAT_NON_LINE`, which makes it possible to use them with other modelings.
